Household Food Consumption Survey 1955
Report No. 13

HOME BAKING by HOUSEHOLDS in the UNITED STATES - - by Region

U. S. DEPARTMENT OF AGRICULTURE

Washington, D. C.

ACKNOWLEDGMENTS

The nationwide survey of household food consumption on which this report is based was made in April-June 1955 by the Agricultural Research Service and the Agricultural Marketing Service of the U. S. Department of Agriculture. The data were collected by National Analysts, Inc., under contract with the Department.

The survey represents the cooperative effort of many individuals in the Department. Faith Clark, Janet Murray, and Ennis C. Blake of the Institute of Home Economics, Agricultural Research Service, had major responsibility for planning and supervision of the survey, with the assistance of George R. Rockwell, Jr., of the Marketing Research Division, and Thomas J. Lanahan,

Jr., of the Agricultural Economics Division of the Agricultural Marketing Service. Consultants for the Department in the design and analysis of the sample were Earl Houseman and Evelyn Grossman.

The survey was carried out under the general direction of Gertrude S. Weiss, Agricultural Research Service, and Robert M. Walsh and James P. Cavin, Agricultural Marketing Service.

This report on home baking was prepared by the Household Economics Research Division, Institute of Home Economics. Mollie Orshansky and Mary Ann Moss had special responsibility for the report.

HOME BAKING BY HOUSEHOLDS IN THE UNITED STATES--BY REGION

Agricultural Research Service and Agricultural Marketing Service

SUMMARY

Three out of four housekeeping households in the United States did some home baking of batters or doughs in a week, according to a nationwide food consumption survey made in the spring of 1955. In fact, except for bread, which nearly all of the families bought, and rolls and sweet buns and the like, most of the baked goods served at home in the survey week came from the home oven rather than from commercial bakeries. This was true in both farm and nonfarm households, although nonfarm families generally did less baking and more buying than the farm families. A goodly share of many of the home-baked products was made from purchased flour mixes.

The products considered in the study of home baking included 2 requiring yeast--namely bread and rolls, and 9 not requiring yeast--gingerbread, biscuits, griddlecakes (or waffles), cornbread, muffins, pie crust, cake with fat, cake with no fat, and cookies. The types of products most commonly made at home during the survey week were cakes, pies, and quick breads. Half of the families had at least one home-baked cake or pie and the same proportion had some form of home-baked quick bread.¹ Of the 11 items, cake with fat was baked by more households (36 percent) than any other, with biscuits, baked by 31 percent, a close second. Gingerbread was baked by the smallest proportion of the households (3 percent).

About half of the households that did not make any of the 11 items at home during the survey week made some during the preceding month and three-fourths made some during the preceding 12 months. Thus in 9 out of 10 households, home-baked cakes, pies, biscuits, or the like appeared on the family table in the course of a year, though in some cases only on special occasions.

Among the households that baked any of the products included in the survey, 31 percent made only 1 and 20 percent made 4 or more different kinds.² Many homemakers made the same item more than once during the week. This was particularly true of hot breads--nearly three-fourths of the homemakers who made cornbread or biscuits made them more than once. It was true in some measure of the other products as well. For example, half of the homemakers

¹ Five percent of the households made no batter dough other than griddlecakes or waffles, which are included with biscuits, muffins, and other quick breads, but are not ovenbaked. If baking is defined as oven baking only, 69 percent of the households baked one or more of the 10 items studied and 48 percent of the households baked quick breads in the survey week.

² Each of the 11 foods was considered 1 item, regardless of the number of batches made.

making pie crust and the same proportion of those making griddlecakes or cookies made them two or more times, and while relatively few baked any bread, a third of those who did baked it more than once.

How household practices with respect to home baking and purchasing of bakery products compared at the time of the survey is shown by the following percentages of households baking and buying specified items during the week:

	<i>Percentage baking</i>	<i>Percentage buying¹</i>
Bread	5	94
Rolls.....	6	20
Gingerbread.....	3	(²)
Biscuits.....	31	8
Muffins.....	3	
Griddlecakes, waffles.....	24	(²)
Cornbread.....	24	0
Pie crust	28	11
Cake	39	22
Cookies	12	50
Sweet buns, coffee cake.....	(³)	
Doughnuts	(⁴)	

¹ As shown in Report No. 1, 1955 Household Food Consumption Survey Series. The survey reported purchased items used in the week rather than bought in the week, but for a large group of households the number using would on the average be the same as the number buying.

² Less than 0.5 percent.

³ Included with rolls if yeast raised and with biscuits if not yeast raised.

⁴ Data not available.

The data obtained on use of commercial mixes during the survey week showed that gingerbread, though the least likely of the 11 items to be baked at home, was the most likely to be made from a mix. Griddlecakes and cake with no fat were next in order. Except for bread, for which there were few mixes on the market, cornbread was the least likely of the items to be prepared from a purchased mix. Chocolate cake and marble or spice cake were more likely to be made from a mix than were other types of cake with fat, but fewer than half of all cakes with fat were made from a mix, compared with nearly two-thirds of the cakes without fat (i.e., angel or sponge).

The following figures show the percentage of households that baked each of the specified items during the survey week and the percentage of those baking that used a commercial mix:

	<i>Percentage baking</i>	<i>Percentage of those baking using mix</i>
Bread, rolls (with yeast)	9	--
Bread	5	1
Rolls	6	13
Cake, pie	52	--
Cake	39	49
With fat	36	48
With no fat	6	65
Pie crust	28	18
Cookies	12	16
Quick breads ¹	53	--
Biscuits	31	21
Griddlecakes, waffles	24	65
Cornbread	24	11
Muffins	3	29
Gingerbread	3	74
Any ¹	74	--

¹ 5 percent of all households baked only griddlecakes or waffles. Excluding these would bring the percentage of households making quick breads to 48 and the percentage doing any oven baking to 69.

TRENDS IN HOME BAKING

The amount of home baking in 1955 was no doubt less than in earlier years, but how much less is difficult to say because no earlier data for the United States as a whole are available for comparison. Some measure of the amount of change may be inferred from the decrease in the amount of flour used at home which averaged only 1 pound per person in a week in spring 1955 compared with 1-1/2 pounds in 1942. Most of the flour used in the home goes into baking.

For farm families who, as will be shown later, do considerably more baking than urban families, more direct evidence of the decrease in baking is available. First, there is the decrease in flour used at home between 1942 and 1955, from 2.5 to 1.8 pounds per person in a week, and the accompanying increase in the flour equivalent of purchased baked goods, from 0.5 to 0.9 pounds. Another indication is the change in percentage of farm homemakers in 1955 who reported baking some common items compared with 1948, another year for which data are available. This is illustrated in charts 1 and 2 for the two largest farm regions, the North Central and the South³. In both these regions the percentage of farm families baking bread or rolls, pie, cake, or cookies at any time during a month was considerably lower in spring 1955

³ Housing needs and preferences of farm families...a comparison of data from studies in four regions. M. S. Howard, A. Woolrich, and E. G. Holmes. U. S. Dept. Agr., Agr. Inform. Bul. 96, 63 pp., 1952.

than in the earlier year. (Although some families not making an item in a month did make it during a year, we may assume in general that such families did not make the item regularly.) The largest decrease since 1948 occurred in the baking of bread and rolls, which take the most time to make and appear on the family table in most homes more regularly than other baked goods.

In the South we find home baking decreasing much less for biscuits than for other items. Southern families, as is well known, still like their hot breads.

There is no quantitative measure of the changes in home baking practices among urban families, but if we assume the trend is downward, we can be reasonably sure that it is less pronounced than among farm families. The decrease is probably less than would have taken place if prepared flour mixes had not been introduced on the market.

URBAN-RURAL DIFFERENCES

Earlier reports of the 1955 food survey showed that rural families were using more flour than urban families. Together with the fact that fewer of the rural families used purchased bread and other bakery products, these data confirm the general impression that rural families do more baking. The present report gives quantitative measures of difference in practice. It indicates that baking is by no means a lost art even among urban families. It indicates further that although most farm families bake, nowadays they buy at least some of the baked goods they use as the following figures show:

	<i>Percentage of households using</i>			<i>Pounds used per household¹</i>		
	<i>Urban</i>	<i>Rural nonfarm</i>	<i>Rural farm</i>	<i>Urban</i>	<i>Rural nonfarm</i>	<i>Rural farm</i>
Flour other than mixes	72	89	95	1.4	3.8	7.1
Purchased flour mixes	40	39	34	.6	.7	.6
Home-baked products	67	83	93	--	--	--
Purchased bread	96	92	85	4.7	5.0	4.4
Purchased other bakery products	85	80	74	2.1	1.9	1.5

¹ Based on all households in cell, table 1.

Not only were rural households more likely to bake than were urban households, but they also made more kinds of baked goods. For example, among the urban households that did any baking, 38 percent made just one of the 11 kinds of batters and doughs studied, and 14 percent made 4 or more different kinds; but among the rural farm households baking, only 12 percent made just one kind of batter or dough and 38 percent made 4 or more.

The decline in home baking notwithstanding, cakes, pies, and biscuits served in the home--farm and nonfarm alike--are still likely to be made there rather than purchased. In fact, the percentages of U. S. households having commercially baked cakes during a week generally decreased between 1942 and 1955. In 1942 the percentages were 40 percent for urban households, 26 for rural nonfarm, and 12 for rural farm; corresponding figures from the 1955 survey are 25, 19, and 14 percent. The downward trend, somewhat at variance with the general increase in use of purchased processed foods over the same period, is no doubt related to the growing popularity of prepared flour mixes.

The percentage of all rural farm households using commercial mixes for baked goods, as chart 3 illustrates, was for several items much the same as the urban. However, because fewer urban families baked, the proportion of items for which they used a mix was larger. Among urban homemakers 56 percent of those making a cake used a commercial mix, 31 percent of those making biscuits, and 21 percent of those making pie. Among farm homemakers, mixes were used by 34 percent of those making cake and 8 percent of those making biscuits or pie.

Cookies, not shown on the chart, were baked in 9 percent of urban and 22 percent of farm homes during the survey week. In 20 percent of these city homes and 8 percent of the farm homes the cookies were made from commercial mixes. Griddlecakes or waffles, more likely to be made from mixes than most other products, were baked in 25 percent of urban and 29 percent of farm households. In 69 percent of the urban and 47 percent of the farm households making them, a purchased mix was used.

The order of preference in baking among the 11 items considered was, on the whole, the same for urban and rural families: The baking of quick breads and of pie or cake were almost equally likely, while bread or rolls were much less likely to be made than either.

REGIONAL DIFFERENCES

Among families in the four broad regions identified in this study (see Glossary, Regions), those in the Northeast did the least home baking and those in the South did the most. This was true for both farm and nonfarm families, but the regional differences were greater for the nonfarm: 50 percent of the urban families in the Northeast made one or more of the items at home during the survey week compared with 80 percent in the South; corresponding figures for farm families were 88 percent in the Northeast and 97 percent in the South.

There were definite regional patterns also in the kinds of products made. Southern families, less likely to buy bread than families elsewhere, were more likely to make quick breads than bread and rolls or pie and cake. In fact, among southern farm families, nearly all (95 percent) baked cornbread, biscuits, or the like during the week. Half of these families made cornbread seven or more times, often enough to serve at least once a day. Biscuits, too, were baked on the average more than once a day by southern farm families. Urban families in the South also liked hot breads: more than a fourth of the households had home-baked biscuits at least three times in the survey week, and a like number had homemade cornbread.

In the West, as in the South, more households made hot breads at home during the week than baked other items. However, hot breads were served fewer times in the West. For example, few western households made either biscuits or cornbread three times in the week or often enough to average even once every other day.

By contrast with the South and West, in the Northeast and North Central regions the most popular items for home baking were cake and pie, as the following percentages of urban and rural farm families baking specified products show:

	Any of the 11 items ¹	Bread, rolls	Quick breads	Cake, pie
Urban:				
Northeast	50	4	27	34
North Central	72	7	43	54
South	80	6	71	46
West	75	7	54	51
Rural farm:				
Northeast	88	21	48	74
North Central	90	34	58	77
South	97	10	95	68
West	89	32	78	75

¹ Excluding households making only griddlecakes or waffles would reduce the percentages doing oven baking in each region to 43, 66, 76, and 64 respectively for urban families, and 84, 87, 97, and 86 for rural farm families.

The sizable percentages of farm families that made bread or rolls are of particular interest, although except in the South most of the families baking any were obviously buying some also, since the percentages buying bread in the week were 92 in the Northeast, 89 in the North Central region, 91 in the West, and 80 in the South. In the South many farm families used quick breads instead of either home-baked or store-bought bread.

Although families in the South did more baking than those in other regions, fewer of those baking used commercial mixes in the process. Chart 4 illustrates this for a few items for farm families in the South compared with those in the North Central region. The situation is much the same for other items, and for nonfarm families in the South compared with those elsewhere.

In the Northeast, the region where families were least likely to bake, a higher proportion of urban families baking used commercial mixes than elsewhere in the country. However, Northeast farm families that did home baking, though more likely to use mixes than farm families in the South, were less likely to do so for some items than were those in the western or North Central States.

INCOME DIFFERENCES⁴

In view of the known relationship between income and food consumption it might be assumed that higher income families would use more commercial baked goods and fewer home-baked products than those with less money to spend. According to the survey, however, this is not altogether true. Region by region, families with high incomes did not always make larger purchases of bakery products than low-income families. They were as likely to bake at home as those with low incomes and in some cases more likely. For example, in the Northeast where baking was less common than in other regions, we find the percentage of urban families making one or more items during the week rising from 41 percent of those with incomes less than \$2,000 to 60 percent of those with \$6,000 or more. Similarly, among northeastern farm families, the percentage baking was 85 percent in the low-income group and 100 percent in the high. In fact, the only clear-cut instance of decrease in baking with higher

⁴ Among housekeeping households of 2 or more persons. Tabulation by income class not made for 1-person households. See table 1.

income occurred among farm families in the South, where 92 percent of those with \$6,000 or more did some baking during the week compared with 99 percent of those with less than \$2,000. On the whole, there was less difference between income groups within a region in the percentage of families baking than between groups of families at the same income level in different regions.

There was no decrease in the number of items baked as income increased, although there was some shift in the choices of items. The percentage baking more than one item in the week was as much or more at incomes of \$6,000 and over as at incomes under \$2,000, except in the South, where the number of items baked declined somewhat along with the percentage baking any.

As money income increased the percentage of households baking cake and pie increased more consistently than the percentage baking other items. This was true in general for both farm and nonfarm families in each region.

Another finding of interest is the practice with respect to bread and rolls. In the main, high-income families were less likely to make these products than were low-income families, but in the South the reverse was true: as income increased the percentage baking bread or rolls increased also while the percentage baking quick breads decreased. At the same time the percentage buying bread in the South, generally lower than elsewhere in the country, increased more than in other regions. Apparently the traditional southern preference for homemade hot breads is less pronounced at the higher income levels. The percentages of urban and rural farm households in each income group baking bread and rolls and quick breads, and the percentages buying similar products are shown separately for the South and the North (i.e., the Northeast, North Central, and Western regions combined) in the tabulation that follows:

	Percentage baking--		Percentage buying--	
	Bread, rolls	Quick breads	Bread	Biscuits, muffins
Urban				
South:				
Under \$2,000	4	76	90	8
\$2,000-\$3,999	6	77	94	15
\$4,000-\$5,999	7	69	95	18
\$6,000 and over	8	67	99	30
North:				
Under \$2,000	8	37	96	5
\$2,000-\$3,999	7	40	98	7
\$4,000-\$5,999	6	44	98	8
\$6,000 and over	6	43	98	9
Rural farm				
South:				
Under \$2,000	8	98	73	2
\$2,000-\$3,999	11	94	85	4
\$4,000-\$5,999	24	90	90	14
\$6,000 and over	14	81	95	14
North:				
Under \$2,000	31	63	86	2
\$2,000-\$3,999	34	59	89	3
\$4,000-\$5,999	38	56	92	2
\$6,000 and over	29	68	94	3

Among families that did any baking, those with high incomes were more likely to use commercial mixes than those with low incomes, but the trend was neither so marked nor so consistent as might be expected. Cake with fat, biscuits, and griddlecakes were baked by enough families in a region at each income level to warrant mention of the practice with respect to mixes in their preparation. The cake and biscuits made were made from mixes by a greater proportion of the high-income families baking them than the low, with the difference greater for biscuits than for cake. For griddlecakes, however, there was no consistent relationship between the use of mixes and income.

DIFFERENCES BY HOUSEHOLD SIZE AND AGE OF HOMEMAKER

Family characteristics such as number in household and age of the homemaker may also have a bearing on family food practices. To be sure, these characteristics are not independent of each other and are related also in some degree to factors already discussed, namely urbanization, region, and money income. For this report, tabulation of the data on home baking takes into account age of the homemaker and household size (counting 21 meals at home in the survey week as 1 person). Because in some instances such multiple breakdown means that there are only a few cases in a cell the averages shown in the tables by income and age or income and household size may be subject to greater error than those by income alone.

Differences in baking practices among households of different sizes were quite pronounced and fairly consistent. At a given income, larger households were more likely to bake during the week than smaller households, and were more likely also to bake more than one kind of product. This was true for both farm and nonfarm households in each region. The increase in baking by larger households extended to all of the items but was more pronounced for cakes and pies and quick breads than for bread or rolls and cookies. The two single items for which differences in practices by household size were greatest were cake with fat and griddlecakes. There were, however, deviations from this pattern in some region-urbanization-income groups.

Although the larger the household the more likely it was to do some baking during the week, there was no consistent trend in the use of commercial mixes. Apparently the use of a flour mix depends less on household size than on such factors as the skill of the homemaker, the amount of time she can devote to baking, or the special likes and dislikes of her family, factors for which it is difficult to determine systematic variation.

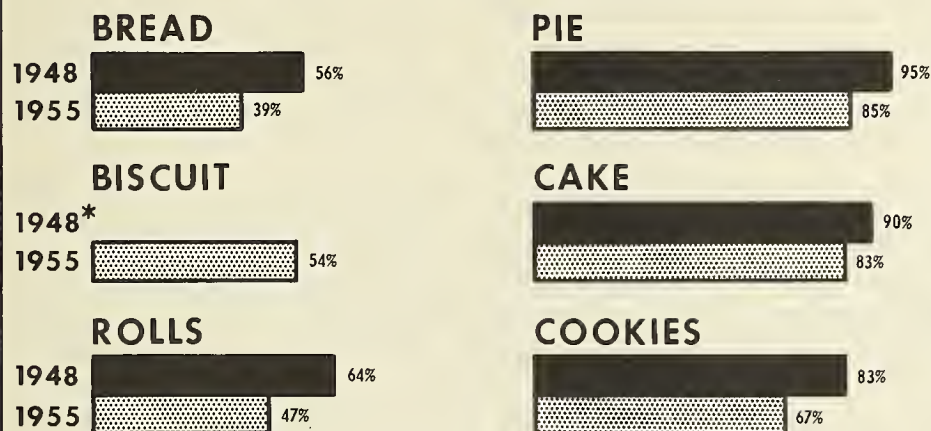

Whether or not a homemaker did any baking was more closely related to the number in her household than to her age. It is true, on the whole, that women 50 years of age or older were less likely to bake than women under 50 in the same region and urbanization, and were likely to bake different things. However, these differences did not always remain when the households were further classified according to money income as well as age of the homemaker.

Of the women who baked, the older ones were less likely to make cake with fat or griddlecakes than the younger ones, but more of the older women made these products "from scratch"--that is, from individual ingredients rather than a purchased mix. The older women were as likely to bake bread or cornbread as were the younger women, and sometimes more likely.

DESCRIPTION OF SURVEY

This report on home baking--defined as making or mixing a batter or dough for 11 specified products by households in 1954-55--contains a part of the data from the nationwide survey of household food consumption made by the U. S. Department of Agriculture in the spring of 1955. Reports published previously presented data on food consumption and dietary levels of households and on home food preservation and production of food for home use in 1954.

Periodic examinations of food consumption and practices of major consuming groups are needed for many purposes--for administration of public programs that affect food supply, distribution, and consumption; for guides in developing educational programs and to improve food habits and food management practices; and for private efforts to broaden and improve the marketing of foods. Nationwide surveys of food consumption of urban and rural households were made in 1936 and 1942 and of urban families in 1948. No surveys of rural families have been made since 1942 except on a regional basis¹. The 1955 survey is the first nationwide survey to report on the extent of home baking by households.

Based on a national probability sample of approximately 6,000 house-keeping households of one or more persons, the 1955 survey is the most comprehensive yet undertaken by the Department. Housekeeping households were defined as those in which at least one member ate 10 or more meals from home food supplies during the week preceding the interview. Institutions and persons who were living on military reservations were not represented. To assure adequate farm coverage, the sample included in addition to a basic cross-section of about 4,500 urban, rural nonfarm, and rural farm households, a supplemental sample of about 1,500 farm-operator households. Hence it was necessary in combining the data for rural farm and the other urbanizations, to use appropriate weights in order to obtain the "all-urbanization" averages. A more detailed description of the sample design and its appraisal is given in Reports 1 to 5 of this series.

Households in the survey were grouped (1) by region--Northeast, North Central, South, and West (Census of Population regions, see Glossary, Regions); (2) by urbanization--rural farm, rural nonfarm, and urban within regions;

¹ See page 130 for list of earlier surveys.

and (3) by several family income classes and household size groups within region-urbanization categories.

Collection of the data, during April, May, and June of 1955, was by personal interview with a household member, usually the homemaker. Information was obtained on family characteristics such as income and household size, and selected household food practices during the previous year, including data on home baking which, with the data on baking during the week preceding the interview, form the subject of this report.

Information obtained on the number of meals eaten at home and away from home by household members during the 7 days preceding the interview, the expenditures for the food eaten at home and away, and the quantities of all food items used at home provided the basis for the first 10 reports on food consumption and dietary levels of households. Data on the extent of home food preservation in 1954 and production of food for home use provided the subjects for reports 11 and 12 respectively.

In requesting the information from households, trained interviewers used a detailed food list to help respondents recall, for the preceding week, the quantities and money value of food used and the batters and doughs prepared², and for the year 1954, the foods preserved by freezing or canning, and the quantities of food produced for home use. (This method is sometimes referred to as the "recall-list method.") As the success of surveys of this type depends in large part on the interviewer's skill in drawing out the necessary information from the person interviewed, considerable care was taken in the selection and training of the interviewers. In training schools of 2 to 5 days, interviewers had instruction and practice in the sampling phase of the survey, in interviewing, and in recording in correct form on the schedule. Manuals of instruction, prepared by the contractor and reviewed by the USDA staff, were used in training schools and served as reference tools for interviewers during the collection period.

A glossary beginning on page 128 explains major terms used in the study.

² Those who had prepared none during the week were asked if they had prepared any during the month or year preceding the interview.

NOTES ON USE OF TABLES

Fourteen tables are presented for the United States and each of four regions. Statistics are shown separately for urban, rural nonfarm, and rural farm households as well as for all urbanizations. All tables include breakdowns by family income and by number in household. Most of the tables also include two-way classification; one by income and number in household and another by income and age of homemaker.

Table 1 gives the counts of households participating in the survey and the average number eating out of household food supplies during the survey week (counting 21 meals at home in the week as 1 person).

The remaining tables include information on the baking of 11 food items--bread (with yeast), rolls (with yeast), gingerbread, biscuits, griddlecakes (or waffles), cornbread, muffins, pie crust, cake with fat, cake with no fat, and cookies. For each of these items the tables show the percentage of households making any during the week, month, or year preceding the interview, and for the items (other than bread, gingerbread, or muffins) made during the week, whether or not a commercial mix was used.

For 7 of the 11 items, namely, bread, biscuits, griddlecakes, cornbread, pie crust, cake with fat, and cookies, is shown also the average number of times baked during the week with a distribution of the number of times. For three items--bread, cake with fat, and cake with no fat--the number of units baked per time is shown. For rolls, only the average number of times baked

is given. The specific kinds of cake with fat made during the survey week and whether or not commercial mixes were used are shown in table 13.

For the convenience of those wishing to make combinations other than those given, all cells in the tables were filled. When combinations for groups of households are needed, they may be computed by using the counts of households shown in table 1. In making combinations, the appropriate adjustments for the oversampling of the rural farm households must be made. For example, in combining income classes for "all urbanizations," the column showing the weighted counts, where this adjustment has already been made, should be used. In combining rural farm and rural nonfarm into a single rural group, the full count of rural nonfarm, but only one-fourth of the rural farm households shown in table 1, should be used.

Some percentages shown in the tables may be subject to considerable error because they are based on few cases. An example is the percentage of households making an item and using a mix, if the total number of households making the item was small. The total number making each item, with or without a mix, is given in table 7, col. 4. Because of the weighting necessary in obtaining the totals for all urbanizations (urban, rural nonfarm, and rural farm combined) when, as sometimes happened, 1 or 2 rural farm households were the only ones in a particular income-age or income-household size classification to bake a specified food, the computed total for all urbanizations of households baking the item could be less than one. Such instances have been designated in the tables by two asterisks (**).

LIST OF TABLES

1/ 21 meals at home in survey week = 1 person. 2/ The sample contains 4 times as many rural farm schedules as are required to provide proportionate representation of all groups. "All urbanizations" is shown both with and without the extra schedules. The effective sample size (i.e., the size a self-weighting sample would have to be to yield the same standard error as the existing sample), which would be used for judging reliability of the tabulated data, is somewhere between the two. The total including all farm schedules is the correct estimate of the effective sample when the standard deviation of the nonfarm data is 1/2 that of the farm. The total including 1/4 of the farm schedules collected is more nearly correct when the standard deviation of the nonfarm data is 1-1/2 that of the farm. Limited evidence from previous studies suggests that this ratio is less than 1 for most items. 3/ Includes a few urban farm families. 4/ Households with primary economic family of 1 person. 5/ Households with primary economic family of 2 or more persons and those with no economic family during the week preceding the interview and/or in 1954. 6/ Includes families unwilling or unable to report their income; includes also the few households with no economic family during the week preceding the interview and/or in 1954.

Note: Component items may not add to totals because of rounding.

1/ 21 meals at home in survey week = 1 person. 2/ The sample contains 4 times as many rural farm schedules as are required to provide proportionate representation of all groups. "All urbanizations" is shown both with and without the extra schedules. The effective sample size (i.e., the size a self-weighting sample would have to be to yield the same standard error as the existing sample), which would be used for judging reliability of the tabulated data, is somewhere between the two. The total including all farm schedules is the correct estimate of the effective sample when the standard deviation of the nonfarm data is 1/2 that of the farm. The total including 1/4 of the farm schedules collected is more nearly correct when the standard deviation of the nonfarm data is 1-1/2 that of the farm. Limited evidence from previous studies suggests that this ratio is less than 1 for most items. 3/ Includes a few urban farm families. 4/ Households with primary economic family of 1 person. 5/ Households with primary economic family of 2 or more persons and those with no economic family during the week preceding the interview and/or in 1954. 6/ Includes families unwilling or unable to report their income; includes also the few households with no economic family during the week preceding the interview and/or in 1954.

Note: Component items may not add to totals because of rounding.

Table 2.--BREAD AND ROLLS, GINGERBREAD BAKED DURING YEAR

1/ 21 meals at home in survey week = 1 person. 2/ The sample contains 4 times as many rural farm schedules as are required to provide proportionate representation of all groups. "All urbanizations" is shown both with and without the extra schedules. The effective sample size (i.e., the size a self-weighting sample would have to be to yield the same standard error as the existing sample), which would be used for judging reliability of the tabulated data, is somewhere between the two. The total including all farm schedules is the correct estimate of the effective sample when the standard deviation of the nonfarm data is 1/2 that of the farm. The total including 1/4 of the farm schedules collected is more nearly correct when the standard deviation of the nonfarm data is 1-1/2 that of the farm. Limited evidence from previous studies suggests that this ratio is less than 1 for most items. 3/ Includes a few urban farm families. 4/ Households with primary economic family of 1 person. 5/ Households with primary economic family of 2 or more persons and those with no economic family during the week preceding the interview and/or in 1954. 6/ Includes families unwilling or unable to report their income; includes also the few households with no economic family during the week preceding the interview and/or in 1954.

Note: Component items may not add to totals because of rounding.

Table 2.--BREAD AND ROLLS, GINGERBREAD BAKED DURING YEAR

NORTH CENTRAL
BY URBANIZATION

Percentage of households baking during the week, month, or year preceding the interview, April-June 1955; housekeeping households of 1 or more persons, by urbanization, income, and number in household

* Less than 0.05 times. ** Total, weighted to allow for oversampling of farm population, less than 1. See "Notes on Use of Tables," page 7.

1/ Includes corn muffins, corn sticks. 2/ Includes households baking but not reporting times baked. 3/ Commercial mix used in baking at least one time but not necessarily every time.

4/ 21 meals at home in survey week = 1 person. 5/ Includes homemakers not reporting age.

Table 11.--PIE CRUST BAKED DURING WEEK

1/ 21 meals at home in survey week = 1 person. 2/ The sample contains 4 times as many rural farm schedules as are required to provide proportionate representation of all groups. "All urbanizations" is shown both with and without the extra schedules. The effective sample size (i.e., the size a self-weighting sample would have to be to yield the same standard error as the existing sample), which would be used for judging reliability of the tabulated data, is somewhere between the two. The total including all farm schedules is the correct estimate of the effective sample when the standard deviation of the nonfarm data is 1/2 that of the farm. The total including 1/4 of the farm schedules collected is more nearly correct when the standard deviation of the nonfarm data is 1-1/2 that of the farm. Limited evidence from previous studies suggests that this ratio is less than 1 for most items. 3/ Includes a few urban farm families. 4/ Households with primary economic family of 1 person. 5/ Households with primary economic family of 2 or more persons and those with no economic family during the week preceding the interview and/or in 1954. 6/ Includes families unwilling or unable to report their income; includes also the few households with no economic family during the week preceding the interview and/or in 1954.

Note: Component items may not add to totals because of rounding.

Table 2.--BREAD AND ROLLS, GINGERBREAD BAKED DURING YEAR

SOUTH
BY URBANIZATION

Percentage of households baking during the week, month, or year preceding the interview, April-June 1955; housekeeping households of 1 or more persons, by urbanization, income, and number in household

* Less than 0.05 times. ** Total, weighted to allow for oversampling of farm population, less than 1. See "Notes on Use of Tables," page 7.

1/ Includes households baking but not reporting times baked. 2/ Commercial mix used in baking at least one time but not necessarily every time.

3/ 21 meals at home in survey week = 1 person. 4/ Includes homemakers not reporting age.

1/ 21 meals at home in survey week = 1 person. 2/ The sample contains 4 times as many rural farm schedules as are required to provide proportionate representation of all groups. "All urbanizations" is shown both with and without the extra schedules. The effective sample size (i.e., the size a self-weighting sample would have to be to yield the same standard error as the existing sample), which would be used for judging reliability of the tabulated data, is somewhere between the two. The total including all farm schedules is the correct estimate of the effective sample when the standard deviation of the nonfarm data is 1/2 that of the farm. The total including 1/4 of the farm schedules collected is more nearly correct when the standard deviation of the nonfarm data is 1-1/2 that of the farm. Limited evidence from previous studies suggests that this ratio is less than 1 for most items. 3/ Includes a few urban farm families. 4/ Households with primary economic family of 1 person. 5/ Households with primary economic family of 2 or more persons and those with no economic family during the week preceding the interview and/or in 1954. 6/ Includes families unwilling or unable to report their income; includes also the few households with no economic family during the week preceding the interview and/or in 1954.

Note: Component items may not add to totals because of rounding.

Table 2.--BREAD AND ROLLS, GINGERBREAD BAKED DURING YEAR

WEST

* Less than 0.05 times. 1/ Includes households baking but not reporting times baked. 2/ Commercial mix used in baking at least one time but not necessarily every time. 3/ 21 meals at home in survey week = 1 person. 4/ Includes homemakers not reporting age.

GLOSSARY

AGE OF HOMEMAKER

Age at last birthday.

ALL URBANIZATIONS

A total for all households in the United States or a region, with the data for nonfarm and rural farm appropriately weighted. See "Urbanization."

BAKING

A family was considered to have baked a specific product if it reported making or mixing a batter or dough for the product.

BREAD

Raised with yeast, baked in a loaf.

CAKE MADE WITH FAT

White, yellow, chocolate, other (i.e., marble, spice).

CAKE MADE WITH NO FAT

Angel, sponge.

CORNBREAD

Including cornsticks or corn muffins made with cornmeal.

FAMILY, ECONOMIC

Defined for purposes of this study as a person living alone or a group of persons who lived together and drew from a common fund for their major items of expense. All unmarried sons and daughters who lived at home were considered part of the economic family. Other persons, related or unrelated, were included if they drew from the common family fund for food, housing, and automobile expenses and, in addition, for at least one other category of major expense such as clothing or medical care, or if they pooled their savings with those of the family. Family members temporarily away from home--at school, at work, or on vacation--were considered members of the economic family, even though not residing in the dwelling unit at the time of the interview.

FAMILY, ECONOMIC, PRIMARY

There may have been more than one economic family in a household unit. If so, the one that was more closely connected with maintaining the dwelling unit was the "primary" one. When households were classified by income, the income of the primary economic family was used for classification. See "Money income."

FAMILY, ECONOMIC, SECONDARY

If two or more economic families were present in a household, members of the one not considered primary (see above) were considered in the same way as boarders and hired help, i.e., they were counted in terms of 21-meal equivalents in computing household size, but information on their expenses for food away from home and their income was not requested.

FARM

Defined as in the United States Census of Agriculture, 1950: Places of 3 or more acres were counted as farms if the value of agricultural products raised on them in 1954, exclusive of home gardens, amounted to \$150 or more. The agricultural products could have been either for home use or for sale. Places of less than 3 acres were counted as farms only if the value of sales of agricultural products in 1954 amounted to \$150 or more.

FARM HOUSEHOLDS

A household that included a farm operator. See "Farm" and "Farm operator." Those few farm households that lived in urban places were tabulated as urban households.

FARM OPERATOR

As defined in the United States Census of Agriculture, 1950: A person who was responsible for the operation of farm land. He may have performed the labor himself or directly supervised it; he may have been either an individual operator or one of a group of individuals acting as partners. Control may have been through ownership, or through lease, rental, or cropping arrangement. An operator was distinguished by the decision-making function. A hired manager was considered an operator inasmuch as he was hired to make decisions and normally to do farm work. A farm laborer who worked for wages and did not make decisions was not considered a farm operator. A person who rented land to others, receiving a share of the product or cash for use of the land, was considered a landlord, not a farm operator.

HOMEMAKER

Wife of the head of the family or herself the head.

HOUSEHOLD

Group of persons who shared family food supplies. Includes members of primary and secondary families, guests, boarders, household help, and farm help. A household did not necessarily include an economic family. Two or more girls who shared an apartment, for example, may have been a household and yet did not constitute an economic family. See "Family, economic."

HOUSEHOLD ELIGIBLE FOR SURVEY

One in which at least 1 person had 10 or more meals from household food supplies during the survey week, that is, the 7 days preceding the interview in April-June 1955.

HOUSEHOLD SIZE IN WEEK

Number of persons in 21-meal equivalents, obtained by dividing by 21 the total number of meals from family food supplies served to all persons in the household (family members, guests, boarders, household help, farm help) during the survey week in the spring of 1955.

For use in classifying households, as in table 1, the following intervals were used:

2 persons.	Fewer than 2.46 equivalent persons
3 persons.	2.46-3.45 equivalent persons
4 persons.	3.46-4.45 equivalent persons
5 persons or more	4.46 or more equivalent persons

MONEY INCOME, AFTER INCOME TAXES

Money income, after deduction of State and Federal income tax payments, of all persons who were members of the primary economic family during all or any part of 1954. Income included wages and salaries paid to family members; net income from self-employment including farming, from real estate, and from boarders; interest, dividends, and mineral rights; pensions, annuities, allotments, contributions, relief payments, and social security; unemployment insurance payments; and gross receipts from roomers. Excluded were lump-sum payments of inheritances and insurance policies. Farm income was the total of all farm receipts during the year (after payment of share rent to others) minus farm operating expenses. Farm operating expenses did not include purchase of land, depreciation or purchase of machinery, or building improvements. Net change in inventories of livestock or crops was not counted as income.

Some households were not classified by income, either because they did not contain an economic family during the week of the survey or during the year 1954, or because they were unable or unwilling to give the information regarding income. See "Not classified by income."

MUFFINS

Muffins other than those made with cornmeal.

NOT CLASSIFIED BY INCOME

Households that were not economic families during the week of the survey or during the year 1954 and households that were unable or unwilling to give information about income.

NUMBER IN HOUSEHOLD IN WEEK

See "Household size in week."

PIE

Pie crust or pastry dough.

QUICK BREADS

Biscuits; griddlecakes or waffles; cornbread, cornsticks, or corn muffins; other muffins.

REGIONS

The 1950 Census of Population classification was used. The States in each of the regions are as follows:

NORTHEAST		
Connecticut	New Hampshire	Pennsylvania
Maine	New Jersey	Rhode Island
Massachusetts	New York	Vermont
NORTH CENTRAL		
Illinois	Michigan	North Dakota
Indiana	Minnesota	Ohio
Iowa	Missouri	South Dakota
Kansas	Nebraska	Wisconsin
SOUTH		
Alabama	Kentucky	South Carolina
Arkansas	Louisiana	Tennessee
Delaware	Maryland	Texas
District of Columbia	Mississippi	Virginia
Florida	North Carolina	West Virginia
Georgia	Oklahoma	
WEST		
Arizona	Montana	Utah
California	Nevada	Washington
Colorado	New Mexico	Wyoming
Idaho	Oregon	

ROLLS

Raised with yeast, including buns and coffee cake.

RURAL FARM

See "Urbanization."

RURAL NONFARM

See "Urbanization."

URBAN

See "Urbanization."

URBANIZATION

Census of Agriculture definitions of urban, rural nonfarm, and rural farm were used. URBAN households lived in communities of 2,500 or more persons or in the fringe areas around cities of 50,000 or more. FARM households were those that included a farm operator, a person responsible for the operation of a farm, either performing the labor himself or directly supervising it. A farm was defined as in the U. S. Census of Agriculture, i.e., a place of 3 or more acres with value of farm products raised (for sale or for home use exclusive of home gardens) amounting to \$150 or more in 1954 or a place of less than 3 acres with value of sales of agricultural products amounting to \$150 or more. See "Farm" and "Farm operator." Those few farm households that lived in

urban places were tabulated as urban households. RURAL NONFARM households were those living outside of urban places that were not classified as rural farm.

Because the sample contains 4 times as many rural farm schedules as were required to provide proportionate representation of all groups, the total *all urbanizations* is a weighted total. The appropriate weights are 1, 1, and 1/4 for urban, rural nonfarm, and rural farm households, respectively. The number of households in each urbanization and region is given in table 1. When combining rural farm data with urban or rural nonfarm data it is necessary to divide by 4 the number of rural farm households shown in table 1.
